How to Use Copper Sulfate in Garden

By [Idris](#) on [Friday, November 25, 2022](#)

Chemically speaking, copper and sulfur are combined to form copper sulfate. Due to its intense blue hue, it is often referred to as “blue stone.”

In gardens, copper sulfate can be used to eradicate weeds, algae, fungus, and pests without endangering the soil or neighboring plants.

Copper sulfate has long been used in gardening. This substance may be used on plants to manage a variety of issues, including moss, fungus, and algae.

When combined with other herbicides or sprayed directly into the soil where weeds are growing, copper sulfate is also a powerful weed killer.

Aphids, whiteflies, spider mites, and scale insects are just a few of the pests that copper sulfate may successfully eradicate.

Conclusion

Copper sulfate can be applied to the soil or by foliar feeding in the garden. Spray the plants’ leaves with a solution made by combining one tablespoon of copper sulfate with one gallon of water for foliar feeding. Once a week until you get the desired results, repeat this.
